

CASE STUDY

D365 Finance & Operations Enhancement Program for
Canon Medical Systems ANZ

Advanced Warehouse Management for Serialised Medical Equipment & Automated Corporate Card Expense Management

100% Barcode Scan Compliance on Receipt & Dispatch	80% Reduction in Expense Processing Time	10 Power BI Reports Delivered	90% Reduction in Manual Data Entry Errors

Figures shown are illustrative placeholders – replace with confirmed program metrics.

Executive Summary

Canon Medical Systems ANZ, a leading provider of diagnostic imaging and medical equipment, engaged our team to enhance its existing Microsoft Dynamics 365 Finance & Operations (D365FO) platform across two distinct but equally critical business areas: warehouse operations and corporate expense management.

On the warehouse side, Canon Medical's global head office mandated a strict barcode scanning requirement for every item received into or dispatched from the warehouse, alongside the ability to allocate serial numbers to individual parts well in advance of shipment – a requirement driven by the traceability standards expected in the medical device industry. The existing Standard Warehouse Management configuration in D365FO could not support either requirement, prompting an upgrade to Advanced Warehouse Management (AWM).

In parallel, our team implemented a corporate credit card program for employee expense management, building an automated solution to ingest bank-issued transaction files, intelligently classify personal versus business expenses, and surface spend insights through Power BI reporting.

Client Overview

Client	Canon Medical Systems ANZ
Industry	Medical Devices & Diagnostic Imaging Equipment
Existing Platform	Microsoft Dynamics 365 Finance & Operations (D365FO), live on Standard Warehouse Management
Business Drivers	Global head office mandate for barcode scan compliance on all warehouse movements; advance serial number allocation for traceability; modernisation of employee expense management
Solution	Advanced Warehouse Management (AWM) implementation; corporate credit card expense automation with Power BI reporting

The Challenge

Warehouse Operations

- **Mandatory barcode scanning** – Canon Medical's global head office required that every item be scanned at the point of receipt and again at the point of dispatch from the warehouse, for full traceability of medical equipment and parts. Standard Warehouse Management in D365FO does not enforce mandatory scanning at these checkpoints.
- **Advance serial number allocation** – A specific operational requirement existed to allocate a serial number to an individual part well before it physically shipped from the warehouse – supporting downstream traceability, compliance documentation, and customer-facing serial records that needed to be finalised ahead of dispatch. This level of serial number control is not available under Standard Warehouse Management.
- **Industry-specific traceability** – As a medical device distributor, Canon Medical operates under stricter traceability expectations than typical distribution businesses, given the regulatory and patient-safety context of the equipment being shipped.

Corporate Expense Management

- **Manual expense processing** – Employee expense processing relied on manual entry and reconciliation of corporate credit card transactions, creating administrative overhead for finance and slow turnaround for expense claims.
- **Personal vs. business expense classification** – Corporate card transactions naturally include a mix of business and personal expenses, and no automated mechanism existed to distinguish between the two during processing.
- **Limited spend visibility** – Finance and management lacked consolidated, visual reporting on corporate card spend patterns across the organisation.

Solution Part 1: Advanced Warehouse Management

Our team upgraded Canon Medical Systems ANZ from Standard Warehouse Management to Advanced Warehouse Management (AWM) within their existing D365FO environment, specifically configured to meet head office's traceability mandate.

Key Capabilities Delivered

- **Mandatory scan-on-receipt and scan-on-dispatch** – Configured mandatory mobile device scanning steps within inbound and outbound work templates, ensuring every item is scanned on receipt (put-away) and again on dispatch (load/shipment confirmation), with no ability to bypass the scan step.
- **Early serial number allocation** – Designed a serial number allocation process that enabled warehouse staff to assign and record serial numbers against individual parts ahead of the physical pick/pack/ship cycle, decoupling serial number assignment from the shipment event itself – a configuration not natively supported under Standard WMS.
- **Location & work template configuration** – Configured location directives, work templates, and mobile device menus tailored to Canon Medical's parts and equipment handling processes.
- **Data migration from Standard to Advanced WMS** – Migrated existing on-hand inventory, open transactions, and serial-tracked items from Standard WMS into the new AWM structure with full reconciliation.
- **Compliance validation** – Validated the end-to-end scan-and-serialise process against head office's traceability requirements prior to go-live, with sign-off from Canon Medical stakeholders.

Why This Mattered

For a medical equipment distributor, the ability to prove exactly when, where, and by whom a part was received, serialised, and dispatched is not just an operational nicety — it underpins the traceability standards the medical device industry and Canon's global head office expect. Advanced Warehouse Management gave Canon Medical ANZ the configurable, enforceable controls Standard WMS could not provide.

Solution Part 2: Corporate Credit Card Expense Automation

Our team designed and built an end-to-end solution to automate the processing of corporate credit card transactions into D365FO expense management, including intelligent classification and executive-level reporting.

Key Capabilities Delivered

- **Bank file ingestion** – Built an automated import process to ingest the periodic credit card transaction file issued by the corporate card provider bank, parsing transaction-level detail (merchant, amount, date, cardholder) directly into D365FO.
- **Automated expense creation** – Configured the import process to automatically generate draft expense entries in D365FO Expense Management from each parsed transaction, removing the need for manual re-keying by employees or finance.
- **Personal vs. business expense differentiation** – Designed a classification mechanism allowing transactions to be distinguished as personal or business expense, ensuring personal charges on the corporate card are correctly routed for employee reimbursement to the company rather than processed as a business cost.

- **Power BI reporting** – Built Power BI reports providing finance and management with visibility into corporate card spend by employee, category, cost centre, and personal-vs-business split – turning previously siloed transaction data into actionable spend insight.

Why This Mattered

By automating the link between the bank's transaction feed and D365FO Expense Management, Canon Medical ANZ eliminated a significant manual reconciliation burden on finance staff, while the personal/business classification logic protected the business from inadvertently absorbing personal employee spend as a company cost. The Power BI layer gave leadership a consolidated, ongoing view of corporate card spend that did not previously exist.

Our Approach

Phase	Activities
Discovery & Design	Captured head office traceability requirements and existing warehouse process gaps; documented bank file format and expense classification rules for the credit card solution
Build & Configure	Configured AWM location directives, work templates, and mobile scanning workflows; built the credit card file import and classification logic; developed Power BI report models
Data Migration	Migrated on-hand inventory and open transactions from Standard WMS to AWM with reconciliation; validated historical transaction data structure for expense reporting
Testing & Validation	Dry-run cutover testing for AWM in UAT; end-to-end testing of bank file import through to expense report generation and Power BI refresh
Cutover & Go-Live	Phased warehouse cutover with smoke testing of scan-and-serialise workflows; staged rollout of the corporate card import process alongside the existing expense process
Stabilisation	Hypercare support across warehouse operations and finance teams; refinement of classification rules based on real transaction patterns; user training on new mobile scanning workflows

Outcomes & Business Impact

Replace the placeholders below with confirmed program metrics once available.

Area	Impact
Traceability Compliance	100% of warehouse receipts and dispatches now enforced through mandatory barcode scanning, meeting head office's global mandate
Serial Number Control	Serial numbers can now be allocated to parts ahead of shipment, supporting compliance and customer documentation timelines that were previously constrained by Standard WMS
Expense Processing Time	[X]% reduction in time to process corporate card transactions into approved expense reports
Expense Accuracy	[X]% reduction in personal expenses incorrectly absorbed as business cost following automated classification
Spend Visibility	[X] Power BI reports delivered, giving finance and leadership ongoing visibility into corporate card spend by employee, category, and cost centre
Operational Efficiency	[X]% reduction in manual data entry across warehouse and expense processes combined

Why It Mattered

For Canon Medical Systems ANZ, this program addressed two operationally distinct but equally important needs: meeting a global head-office traceability mandate critical to the integrity of medical equipment distribution, and modernising a manual, error-prone expense management process into an automated, transparent system.

The Advanced Warehouse Management upgrade gave Canon Medical the granular scanning and serial number controls that the medical device industry's traceability expectations demand – capabilities that were structurally unavailable under Standard Warehouse Management. The corporate card automation, meanwhile, removed manual reconciliation burden from finance while protecting the business from absorbing personal spend, and gave leadership a clear, ongoing view of corporate spend through Power BI.

Together, these initiatives reflect a broader pattern in this engagement: extending and enhancing an existing D365FO investment with targeted, high-value capability — rather than requiring a full platform re-implementation — to solve specific, business-critical problems.
